FCC Warning

This equipment has been tested and found to comply with the limits for a Class-A digital device, pursuant to Part 15 of the FCC rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses, and can radiate radio frequency energy. It may cause harmful interference to radio communications if the equipment is not installed and used in accordance with the instructions. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures:

- Reorient or relocate the receiving antenna.
- Increase the separation between the equipment and receiver.
- Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.
- Consult the dealer or an experienced radio/TV technician for help.

Caution: Any changes or modifications not expressly approved by the grantee of this device could void the user's authority to operate the equipment.

CE Mark Warning

This is a Class-A product. In a domestic environment this product may cause radio interference in which case the user may be required to take adequate measures.

1. Introduction

All Antaira industrial managed switches come with a pre-installed “user-friendly” web console interface, which allows users to easily configure and manage the units, whether one is using a serial console and command line interface(CLI) commands like Telnet, SSH, HTTP (Web GUI) or simple network management protocols (SNMP).

1.1 Product Overview

Antaira Technologies’ LMP-1202G-SFP series is a 12-port industrial Gigabit PoE+ managed Ethernet switch embedded with 8*10/100/1000Tx Ethernet ports that support IEEE802.3at/af for a maximum of 30W/port, plus 2*10/100/1000Tx(non-PoE ports) and 2*100/1000 dual rate SFP slots for fiber connections. The LMP-1202G-SFP is a fully manageable Layer 2 Ethernet switch that is pre-loaded with a user-friendly web management console design. It supports the ring network redundancy function using the market’s open standard ITU-T G.8032 ERPS (Ethernet Ring Protection Switch) protocol that has a <50ms network recovery time. The advanced network filtering and security functions, such as, IGMP, VLAN, QoS, SNMP, port lock, RMON, Modbus TCP, and 802.1X/HTTPS/SSH/SSL increase determinism and improve network management for remote SCADA systems or control networks.

The LMP-1202G-SFP series is IP30 rated and DIN-rail mountable. There are also two wide operating temperature models for either a standard temperature range (STD: -10°C to 70°C) or an extended temperature range (EOT: -40°C to 75°C). It also provides high EFT and ESD protection for industrial networking applications, such as, power/utility, water wastewater, oil/gas/mining, factory automation, security surveillance, ITS and any other outdoor or harsh environment.

1.2 Product Software Features

- Network Redundancy
 - STP, RSTP, MSTP, ITU-T G.8032 Ethernet Ring Protection Switch (ERPS) for network redundancy
- Network Management
 - Web UI based management, SNMP v1/v2/v3, Serial Console
 - Qos, traffic classification QoS, Cos, bandwidth control for Ingress and Egress, broadcast storm control, Diffserv

- IEEE802.1q VLAN tagging, port-based VLAN support
- IGMP snooping v1/v2, IGMP filtering / throttling, IGMP query up to 256 group
- Supports IPv4/IPv6, RMON, MIB II, port mirroring, event syslog, DNS, NTP/SNTP, HTTPS, SSH/SSL, TFTP
- MODBUS TCP for SCADA system integration
- Port Configuration
 - Status, statistics, mirroring, rate limiting, event syslog
- Event Handling
 - Event notification by Email: Cold/Warm Start, Power Failure, Authentication, SNMP trap and Fault Alarm Relay Output
- Software Upgrade via TFTP and HTTP
- Configuration Backup – USB Port

1.3 Product Hardware Features

- System Interface and Performance
 - All RJ-45 ports support Auto MDI Function
 - Embedded 8*10/100/1000Tx (PSE 30W/Port), 2*10/100/1000Tx (Non-PoE) RJ45 Ports and 2*100/1000 SFP slots for fiber
 - Store-and-forward switching architecture
 - 8K MAC address table
 - Power line EFT protection: 2,000VDC; Ethernet ESD protection: 6,000VDC
- Power Input
 - DC 48~55V redundant with a 6-pin removal terminal block
 - One user programmable alarm relay contact
- Operating Temperature
 - Standard operating temperature models: -10°C to 70°C
 - Extended operating temperature models: -40°C to 75°C
- Case/Installation
 - IP-30 protection metal housing
 - DIN-Rail and wall mount design

1.4 Package Contents

- 1– LMP-1202G-SFP series: 12-port industrial gigabit PoE+ managed Ethernet switch, with 8*10/100/1000Tx (PSE 30W/Port) , 2*10/100/1000Tx (Non-PoE) and 2*100/1000 SFP slots for fiber connectivity
- 1-Product CD
- 2-Wall mounting brackets and screws
- 1-RJ45 to DB9 Serial Console cable
- 1-DC cable –18 AWG & DC jack 5.5x2.1mm

1.5 Safety Precaution

Attention: If the DC voltage is supplied by an external circuit, please use a protection device on the power supply input. The industrial Ethernet switch's hardware specs, ports, cabling information, and wiring installation will be described within this user manual.

2. Hardware Description

2.1 Physical Dimensions

Figure 2.1, below, shows the physical dimensions of Antaira's LMP-1202G-SFP series: 12-port industrial gigabit PoE+ managed Ethernet switches with 8*10/100/1000Tx (PSE 30W/Port), 2*10/100/1000Tx (Non-PoE) and ports and 2*100/1000Fx SFP slots.

(W x D x H) is **54mm x 99mm x 142mm**

Figure2.1

LMP-1202G-SFP Series Physical Dimensions

2.2 Front Panel

The front panel of the LMP-1202G-SFP series industrial gigabit PoE+ managed Ethernet switch is shown below in *Figure 2.2*.

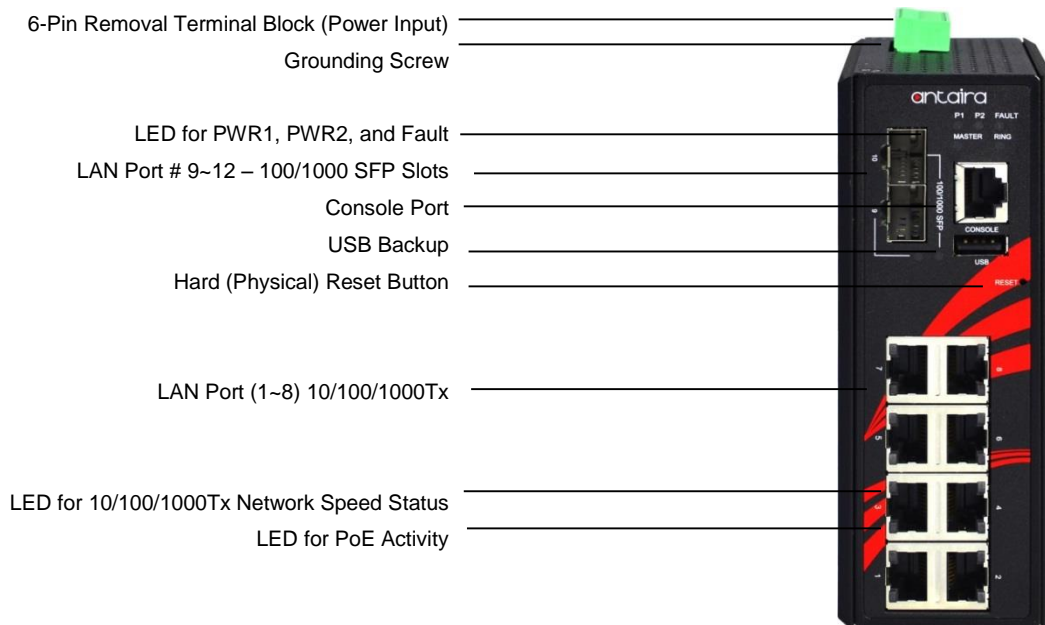

Figure2.2

The Front Panel of LMP-1202G-SFP Series

2.3 Top View

Figure 2.3, below, shows the top panel of the LMP-1202G-SFP series switch that is equipped with one 6-pin removal terminal block connector for dual DC power inputs 48~55VDC.

Figure2.3

Top Panel View of LMP-1202G-SFP Series

2.4 LED Indicators

There are LED light indicators located on the front panel of the industrial Ethernet switch that display the power status and network status. Each LED indicator has a different color and has its own specific meaning, see below in *Table 2.1*.

LED	Color	Description	
P1	Green	On	Power input 1 is active
		Off	Power input 1 is inactive
P2	Green	On	Power input 2 is active
		Off	Power input 2 is inactive
Fault	Green/ Red	Green	Power input 1 or 2 is active
		Red	An applied alarm (such as port disconnect) has been triggered
		Off	System is booting or down
Owner	Green	On	ERPS Owner Mode (Ring Master) is ready
		Off	ERPS Owner Mode is not active
Ring	Green	On	Ring Network is active
		Off	Ring Network is not active
LAN Port 11~12 Link/ACT (SFP Port)	Green	On	Connected to Network
		Flashing	Network is active
		Off	Not Connected to Network
LAN Port 1~10 (Left LED)	Green 	On	Connected to network, 10/100/1000Mbps
		Flashing	Networking is active
		Off	Not connected to network
LAN Port 1~ 8 (Right LED) PoE Indicators	Green 	On	The port is supplying power to the powered-device
		Off	No powered-device attached or power supplying fails

Table 2.1 - LED Indicators for LMP-1202G-SFP Series

2.5 Reset Button

There is a 'Reset' button located on the front panel of the industrial Ethernet switch that helps users to reboot, restore default, or save running configurations by pressing the button for different seconds. Please refer to *Table 2.2* for the timing and function.

Seconds	Function
1	Save running configuration to USB
4-6	Reboot the switch
7 or more	Restore factory default

Table 2.2 – Reset Button Functions

2.6 Ethernet Ports

■ RJ-45 Ports

RJ-45 Ports (Auto MDI/MDIX): The RJ-45 ports are auto-sensing for 10Base-T, 100Base-TX, or 1000Base-T connections. Auto MDI means that the switch can connect to another switch or workstation without changing the straight-through or crossover cabling. See the figures below for straight-through and crossover cabling schematics.

■ RJ-45 Pin Assignments

Pin Number	Assignment
1	Rx+
2	Rx-
3	Tx+
6	Tx-

Table 2.3 - RJ45 Pin Assignments

Note: The "+" and "-" signs represent the polarity of the wires that make up each wire pair.

All ports on this industrial Ethernet switch support automatic MDI operations. Users can use straight-through cables (see figure below) for all network connections to PCs, servers, and other switches or hubs. With straight-through cabling, pins 1, 2, 3, and 6 are at one end of the cable and are connected straight through to pins 1, 2, 3 and 6 at the other end of the cable. The table below (Table 2.3) shows the 10BASE-T/100BASE-TX/1000BASE-T MDI port pin outs.

Pin MDI-X	Signal Name	MDI Signal Name
1	Receive Data plus (RD+)	Transmit Data plus (TD+)
2	Receive Data minus (RD-)	Transmit Data minus (TD-)
3	Transmit Data plus (TD+)	Receive Data plus (RD+)
6	Transmit Data minus (TD-)	Receive Data minus (RD-)

Table 2.4 - Ethernet Signal Pin

The following figures show the cabling schematics for straight-through and crossover.

Figure 2.4
 Straight-Through Cable Schematic

Figure 2.5
 Crossover Cable Schematic

2.7 Cabling

Use the four twisted-pair, category 5e, or the above cabling for the RJ-45 port connections. The cable between the switch and the link partner (switch, hub, workstation, etc.) must be less than 100 meters (328 ft.) in length.

2.8 Wiring the Power Inputs

Please follow the steps below when inserting the power wire.

1. Insert the positive and negative wires into the PWR1 (V1+, V1-) and PWR2 (V2+, V2-) contacts on the terminal block connector as shown below in *Figure 2.6*.

Figure 2.6 - Power Terminal Block

2. Tighten the wire-clamp screws to prevent the wires from loosening, as shown below in *Figure 2.7*.

Figure 2.7 - Power Terminal Block

Note:

- Only use copper conductors, 60/75°C, tighten to 5lbs.
- The wire gauge for the terminal block should range between 18~20 AWG.

2.9 Wiring the Fault Alarm Contact

The fault alarm contact is in the middle of the terminal block connector as the picture shows below in *Figure 2.8*. By inserting the wires, it will detect the fault status including power failure or port link failure (managed industrial switch only) and form a normally open circuit. An application example for the fault alarm contact is shown below in *Figure 2.8*.

Figure 2.8 - Wiring the Fault Alarm Contact

Note

- The wire gauge for the terminal block should range between 12 ~ 24AWG
-

3. Mounting Installation

3.1 DIN-Rail Mounting

The DIN-Rail is pre-installed on the industrial Ethernet switch from the factory. If the DIN-Rail is not on the industrial Ethernet switch, please see Figure 3.1 to learn how to install the DIN-Rail on the switch.

Figure 3.1

The Rear Side of the Switch and DIN-Rail Bracket

Follow the steps below to learn how to hang the industrial Ethernet switch.

1. Use the screws to install the DIN-Rail bracket on the rear side of the industrial Ethernet switch.
2. To remove the DIN-Rail bracket, do the opposite from step 1.
3. After the DIN-Rail bracket is installed on the rear side of the switch, insert the top of the DIN-Rail on to the track as shown below in *Figure 3.2*.
4. Lightly pull down the bracket on to the rail as shown below in *Figure 3.3*.
5. Check if the bracket is mounted tightly on the rail.
6. To remove the industrial Ethernet switch from the rail, do the opposite from the above steps.

Figure 3.2

Insert the Switch on the DIN-Rail

Figure 3.3

Stable the Switch on DIN-Rail

3.2 Wall Mounting

Follow the steps below to mount the industrial Ethernet switch using the wall mounting bracket as shown below in *Figure 3.4*.

1. Remove the DIN-Rail bracket from the industrial Ethernet switch by loosening the screws.
2. Place the wall mounting brackets on the top and bottom of the industrial Ethernet switch.
3. Use the screws to screw the wall mounting bracket on the industrial Ethernet switch.
4. Use the hook holes at the corners of the wall mounting bracket to hang the industrial Ethernet switch on the wall.
5. To remove the wall mount bracket, do the opposite from the steps above.

Figure 3.4

Remove DIN-Rail Bracket from the Switch

Below, in *Figure 3.5* are the dimensions of the wall mounting bracket.

Figure 3.5

Wall Mounting Bracket Dimensions

4. Hardware Installation

4.1 Installation Steps

This section will explain how to install Antaira's LMP-1202G-SFP series: 12-port industrial gigabit PoE+ managed Ethernet switches with 8*10/100/1000Tx (PSE: 30W/Port), 2*10/100/1000 (Non-PoE Ports) and 2*100/1000 dual rate SFP fiber slots.

Installation Steps

1. Unpack the industrial Ethernet switch from the original packing box.
2. Check if the DIN-Rail bracket is screwed on the industrial Ethernet switch.
 - If the DIN-Rail is not screwed on the industrial Ethernet switch, please refer to the **DIN-Rail Mounting** section for DIN-Rail installation.
 - If you want to wall mount the industrial Ethernet switch, please refer to the **Wall Mounting** section for wall mounting installation.
3. To hang the industrial Ethernet switch on a DIN-Rail or wall, please refer to the **Mounting Installation** section.
4. Power on the industrial Ethernet switch and then the power LED light will turn on.
 - If you need help on how to wire power, please refer to the **Wiring the Power Inputs** section.
 - Please refer to the **LED Indicators** section for LED light indication.
5. Prepare the twisted-pair, straight-through category 5 cable for Ethernet connection.
6. Insert one side of the RJ-45 cable into switch's Ethernet port and on the other side into the networking device's Ethernet port, e.g. switch PC or server. The Ethernet port's (RJ-45) LED on the industrial Ethernet switch will turn on when the cable is connected to the networking device.
 - Please refer to the **LED Indicators** section for LED light indication.
7. When all connections are set and the LED lights all show normal, the installation is complete.

5. Web Management

5.1 Web Console Configuration

This section introduces the configuration by web browser.

5.1.1 About Web-Based Management

All of Antaira's industrial managed switches are embedded with HTML web console interfaces that have a flash memory on the CPU board. It is a "user-friendly" design with advanced management features that allow users to manage the switch from anywhere on the network through any Internet browser, such as Internet Explorer (version 9.0 or above is recommended), Firefox, Chrome and many others.

Preparing for Web Console Configuration

Antaira's industrial managed switches come with a factory default value as below:

- Default IP Address: **192.168.1.254**
- Default User Name: **admin**
- Default Password: **admin**

System Login

1. Launch any Internet browser
2. Type in factory default IP address: http://192.168.1.254 of the switch. Press "**Enter**".

antaira™
making connectivity simple...

Model Name: LMP-0800G IP Address: 192.168.1.254 MAC: 7C:CB:0D:FF:FF:01 Firmware Version: 2.4.5

Authorization Required

Please enter your username and password.

Figure 5.2 - Web Console Main (Status) Page

5.2 Basic Setting

5.2.1 System Information

Below, *Figure 5.3*, shows the switch system setting information.

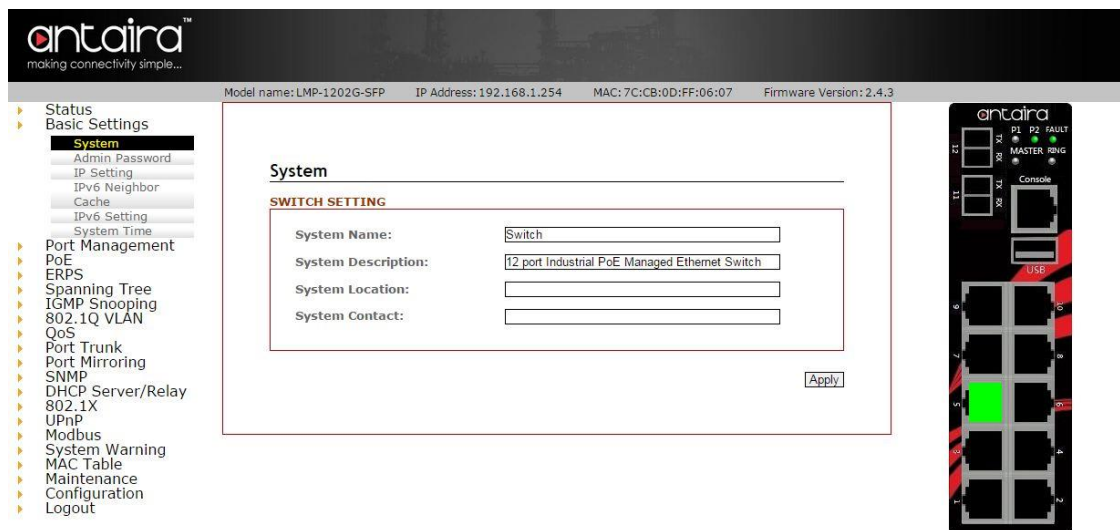

Figure 5.3 – Switch Settings (Status) Page

Terms	Value Description
System Name	Factory Default: Switch *Users can assign any name label to identify this managed node. By convention, the maximum length of the System Name is 32 characters and #, \, ', ", ? are invalid characters.
System Description	Factory Default: 12-port Managed PoE Ethernet Switch The fixed system description is “n port Industrial Managed (PoE) Ethernet Switch”.
System Location	Factory Default: blank *Users can use this field to insert The physical location of this switch (e.g., telephone closet, 3rd floor). The maximum length of System Location is 32 characters and #, \, ', ", ? are invalid characters.
System Contact	Factory Default: blank *Users can insert this field with the administrator of this switch together with information on how to contact this person. The maximum length of System Location is 32 characters and #, \, ', ", ? are invalid characters.
Apply	Click the “Apply” button to save changes.

Figure 5.4 – Switch Settings Description

5.2.2 Admin & Password

Below, describes how to configure the system user name and password for the web console login.

Figure 5.5 – Administrative Account

Terms	Value Description
New Password	Users can assign a New Password and the maximum length of the new password is 20 characters (alphabet and numeric values only)
Confirmation	Re-type the new password.
	Click “Apply” to save changes.

Figure 5.6 – Admin & Password Description

5.2.3 IP Setting

Configure the managed switch’s IP setting information.

Figure 5.7 – IP Setting Information

Terms	Value Description
DHCP Client	Enable the DHCP client by checking this box. If DHCP fails and the configured IP address is zero, DHCP will retry. If DHCP fails and the configured IP address is non-zero, DHCP will stop and the configured IP settings will be used. The DHCP client will announce the configured System Name as hostname to provide DNS lookup.
IP Address	The unit default IP is 192.168.1.254. Assign the IP address that the network is using. If DHCP client function is enabling, user does not require assigning the IP address. The network DHCP server will assign the IP address for the switch and it will be display in this column.
Subnet Mask	Assign the subnet mask of the IP address. If DHCP client function is enabling, user does not require to assign the subnet mask
Gateway	Assign the network gateway for the switch. If DHCP client function is enabled, the user is not required to assign the Gateway.
DNS	Assign the DNS IP address
	Click the "Apply" button to save changes.

Figure 5.8 – IP Setting Information Description

5.2.4 IPv6 Neighbor Cache

The following information provides the current IPv6 neighbors and their states.

IPv6 Neighbor Cache

IPv6 NEIGHBOR CACHE

IPv6 Address	Link Layer(MAC)	Address State
fe80::7941:e3ea:d701:a7cd	c4:6e:1f:03:1e:5a	REACHABLE

5.4 PoE (Power-over-Ethernet)

LMP-1202G-SFP series is one of Antaira’s industrial PoE+ gigabit managed switches that has eight built-in IEEE802.3at complaint ports, and each PoE port can support PoE output power up to a maximum of 30W per port. It is also backward compatible with IEEE 802.af to support any standard PoE powered devices (PD).

5.5 ERPS

In any industrial automation application, designing redundant ring network paths to protect networks from unexpected failovers is extremely important in mission-critical networks because they need to provide uninterrupted services. In practice, several loop protection methods are implemented to ensure that network functions normally without loops and recovers as soon as possible when a point of failure occurs. The most popular ones are RSTP (802.1w) and MSTP (802.1s). For industrial applications, the ERPS (G.8032) is highly recommended since they can achieve faster recovery time than any STP protocol.

Due to different manufacturers who provide their own proprietary redundant ring protocol, and users facing inconvenient situations with compatibility issues when they are planning to design or upgrade their ring network for future proof, Antaira is proud to introduce and implement Ethernet Ring Protection Switching (ERPS) protocol as a standard ring solution for network redundancy with all new industrial managed Ethernet switches. In order to provide users with the flexibility and compatibility when there are any existing switches that contains the standard ERPS protocol.

Ethernet Ring Protection Switching (ERPS), defined in ITU-T G8032, implements a protection switching mechanism for Ethernet traffic in a ring topology. By performing the ERPS function, potential loops in a network can be avoided by blocking traffic to flow to the ring protection link (RPL) to protect the entire Ethernet ring.

In a network with ring topology that runs ERPS, only one switch is assigned as an “owner” that is responsible for blocking traffic in RPL so as to avoid loops. The switch adjacent to the RPL owner is called the RPL “neighbor” node that is responsible for blocking its end of the RPL under normal condition. Other participating switches adjacent to the RPL owner or neighbor in a ring are members or RPL next-neighbor nodes to this topology and normally forward receive traffic. ERPS, like STP, provides a loop-free network by using polling packets to detect faults. When a fault occurs, ERPS heals itself by sending traffic over a protected reverse path less than 50ms and recover quickly to forward traffic. Because of this fault detection mechanism, the network broadcast storm problem could be avoided as well.

5.5.1 ERPS Status

Below is the REPS LED information on the front Panel

Terms	Value Description
MASTER	ON(Green): If one of ERPS ports is set to RPL "Owner". OFF(Gray): No port is set to RPL "Owner"
RING	ON(Green): ERPS works well. ON(Flashing): The ring is open, one of ERPS node link failed or link down or ERPS is misconfigured. OFF(Gray): ERPS is disabled.

Below, *Figure 5.21*, shows the network redundancy ring status with the Ethernet Ring Protection Switch (ERPS) protocol.

ERPS Status	
Protocol:	Disable
Ring ID:	1
Ring State:	Normal
Node State:	INITIAL STATE
Channel:	1000
Revertive:	Enable

Figure 5.21 – Redundant Ring Network – ERPS Status

Terms	Value Description
Ring State	Abnormal: After enabling ERPS, one of ERPS node link failed or link down. Normal: ERPS disable or after enabling ERPS, the ring is closed and working well.
Node State	INITIAL: ERPS disable PROTECTION: One of ERPS node link failed or link down. PENDING: The ring is from open to closed and the WTR timer is counting down. IDLE: After WTR timer is expired or users issue "Clear" command by CLI, the ring is working well.

5.5.2 ERPS Configuration

Below, Figure 5.22 shows the ERPS configuration interface.

The screenshot shows the 'ERPS Configuration' window. It has a title bar 'ERPS Configuration' and a sub-header 'ERPS CONFIGURE'. The configuration fields are as follows:

Protocol:	Enable
Ring Port 0:	Port1
Role:	Owner
Ring Port 1:	Port2
Role:	None
Ring ID:	1
APS Channel:	1000
Revertive:	Yes

An 'Apply' button is located at the bottom right of the configuration area.

Figure 5.22 – ERPS Configuration Interface

Terms	Value Description
Protocol	“Enable” or “Disable” ERPS protocol
Ring Port 0	ERPS ring port 0, it could be map to real switch port 1 – port 6. Do not set the same as Ring port 1.
Ring Port 1	ERPS ring port 1, it could be map to real switch port 1 – port 6. Do not set the same as Ring port 0.
Role	Set the ERPS role as Owner, Neighbor or None. [Owner] In charge of blocking one side of RPL link. It will prevent the packet flow from its blocked port. [Neighbor] In charge of blocking one side of RPL link. It will prevent the packet flow from its blocked port. [None] Besides Owner and Neighbor node, the rest of nodes are defined as None node. All node roles have the ability to block the port if the link attach to the port is failed and disconnected.
Ring ID	ERPS ring ID, ranges from 1 to 239. Ring ID distinguishes different Ring

	topology.
Channel	ERPS Channel ID, ranges from 1 to 4094. It's a channel to send PDUs of ERPS.
Revertive	Set to Revertive (yes) or Non-revertive (no). The revertive mode works only under the scenario A at the RPL Owner node. [Revertive] While the revertive mode is set, the RPL link will be blocked in 5 minutes after recovery form link failure situation. Otherwise, it will remain unchanged of the blocking state. That is, the failed link port will block permanently until the next event happen. [Non-Revertive] The failed ring link the port attached to it will remain blocked even the situation is eliminated.
Apply	Click the "Apply" button to save changes.

Figure 5.23 – ERPS Configuration Terms & Description

5.5.3 Before Configuring ERPS

Before configuring ERPS, the rapid spanning tree protocol (RSTP), or multiple spanning tree protocol is required to disabled, due to only one protocol is exclusive running within a switch. Below are the steps to disable RSTP, or MSTP.

- Step 1:** Login the switch with a web browser.
- Step 2:** Open the "RSTP Configuration" page under the "Spanning Tree" manual shown below in *Figure 5.24*.

Figure 5.24 – Spanning Tree Manual

Step 3: When the RSTP/CIST Configuration page shows up, set “Mode” to “Disable” as shown in *Figure 5.25*.

Figure 5.25 – RSTP/CIST Configuration Interface

Step 4: Press the Apply button in the lower right corner as shown below in *Figure 5.26*.

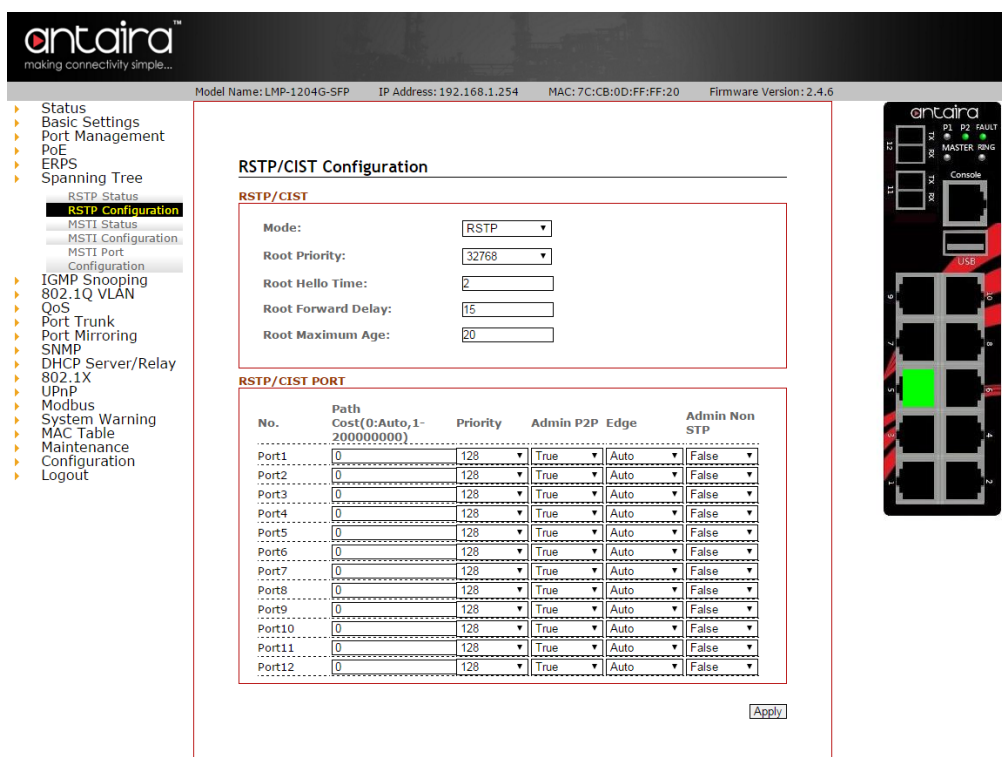

Figure 5.26 – RSTP/CIST Configuration Interface

Ethernet Ring Protection Switch (ERPS) is an Ethernet ring protection protocol which is used to prevent forming the loop in LAN, thus, the Broadcast Storm problem could be avoided. The loop avoidance mechanism ensures the traffic flows on all but the RPL ring link. In order to achieve the loop-avoidance mechanism, ITU-T G.8032 defines three roles in ERPS, which are “RPL Owner Node”, “RPL Neighbor Node”, and “None Node”.

Below are two scenarios describing how to configure the ERPS in Antaira's industrial managed Ethernet switches. Users can reference it to configure the managed switch as RPL-configured architecture as shown in Figure 5.27 or the non-configured architecture shown in Figure 5.31.

5.5.3.1 Scenario A – RPL Configured Architecture

Under scenario A, there are three major roles required to configure within the ERPS configuration.

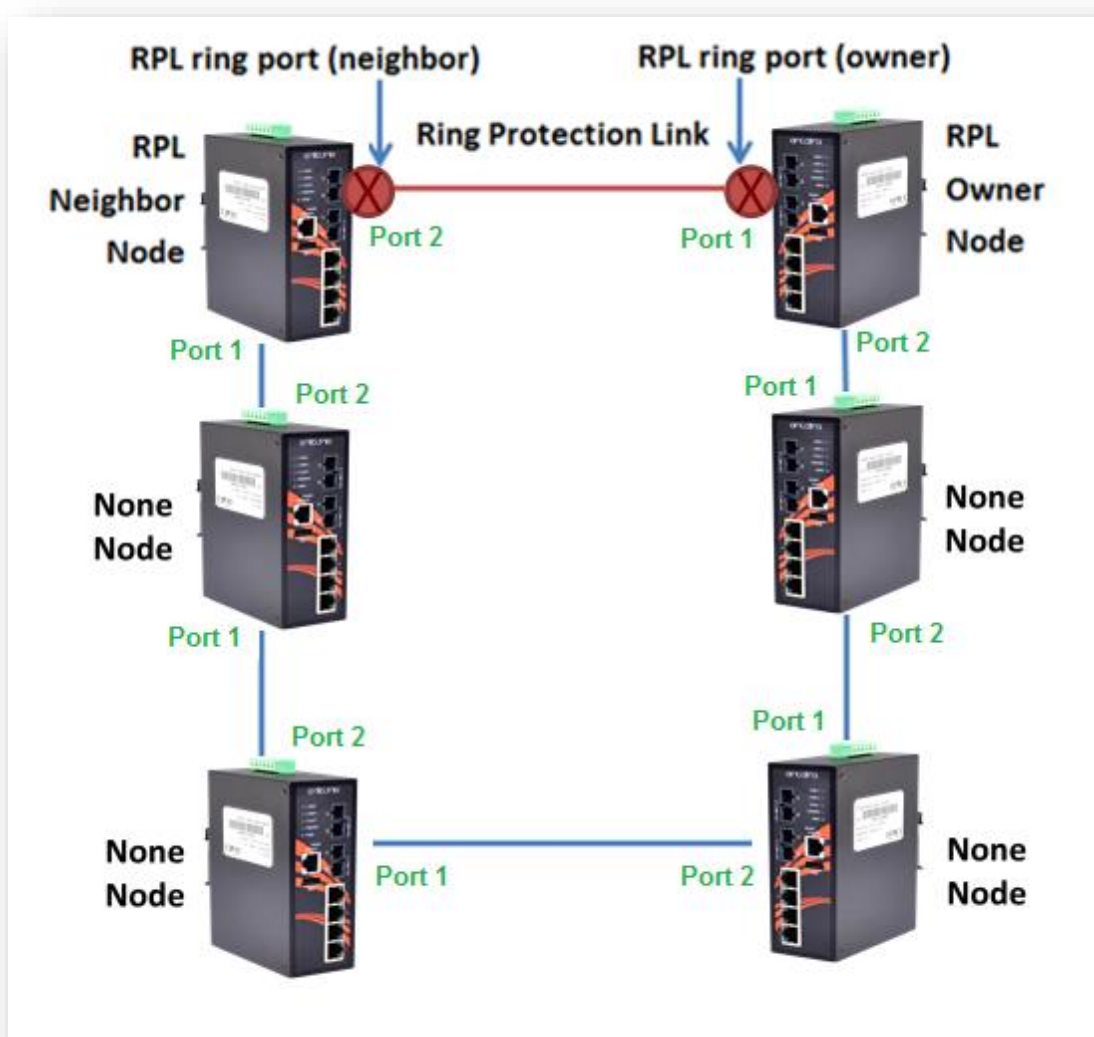

Figure 5.27 – RPL-Configured Architecture

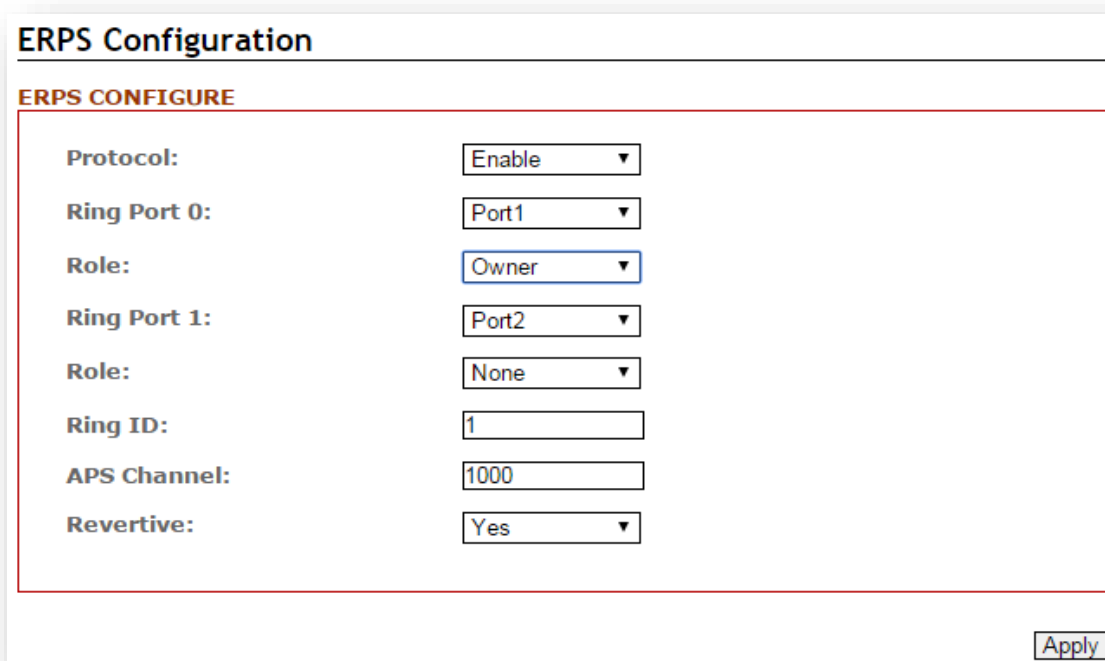

Caution: Before enabling any ERPS protocols on any of the Ring Nodes, please DO NOT connect all switches to form a loop (ring) network yet. There should have at least one ring port leave unplugged until all nodes in the topology are ready.

There is only one RPL Owner Node could be set in a ring network. In order to set up the RPL Owner Node, choose a switch and enable “Protocol” under the ERPS Configuration interface, and follow below steps and use *Figure 5.28*, below, as an example:

- Step 1:** Choose a specific port from the dropdown box next to “ring port 0”, and set it as “Owner” node by clicking the dropdown box next to “Role” below “ring port 0”. At this point, “**Port 1**” was chosen as example.
- Step 2:** Choose a specific port from the dropdown box next to “ring port 1”, then set it as “None” from the dropdown box next to “Role” (which locates below “ring port 1”). At this point, “**Port 2**” was chosen as example.

Note: The port number of “Ring Port 0” and “Ring Port 1” cannot be duplicated.

After the configurations, press the “Apply” button on the right bottom corner to save the setting.

The screenshot displays the 'ERPS Configuration' window. At the top, it says 'ERPS CONFIGURE'. Below this, there are several configuration fields:

Protocol:	Enable
Ring Port 0:	Port1
Role:	Owner
Ring Port 1:	Port2
Role:	None
Ring ID:	1
APS Channel:	1000
Revertive:	Yes

An 'Apply' button is located in the bottom right corner of the configuration area.

Figure 5.28 – RPL Owner Node Setup Example

Please be aware, when the revertive mode is set to “**Yes**”, the ring will recover the same way as explained in *Figure 5.27*, after the ring state form goes from ABNORMAL to NORMAL in 5 minutes. Otherwise, the blocked port will remain blocked permanently unless users reconfigure it.

[RPL Neighbor Node]

Users should choose a second managed switch that is adjacent to the first managed switch and set it up as the RPL neighbor node. For configuration, users should login to the second managed switch's ERPS configuration interface and choose a specific port number under "Ring Port 0" and set it as the "None" node by clicking the dropdown box of "Role"; then, set another specific port number under "Ring Port 1" as the "Neighbor" node as shown below in *Figure 5.29*. So the link between neighbor port and owner port forms the ring protection link (RPL). After the configurations, press the "Apply" button on the bottom right corner to save the settings.

Note: The port number of "Ring Port 0" and "Ring Port 1" cannot be duplicated.

The screenshot shows the 'ERPS Configuration' window with a sub-section titled 'ERPS CONFIGURE'. It contains the following fields:

Protocol:	Enable
Ring Port 0:	Port1
Role:	None
Ring Port 1:	Port2
Role:	Neighbor
Ring ID:	1
APS Channel:	1000
Revertive:	Yes

An 'Apply' button is located at the bottom right of the configuration area.

Figure 5.29 – RPL Neighbor Node Setup Example

[None Node]

Then users should setup the rest of the managed switches' "Role" of both "Ring Port 0 and 1" as "None Node" as shown above in *Figure 5.27*. Please be sure no duplicate port number has been chosen within a managed switch's ERPS ring setting, the incorrect configurations may lead to unexpected errors.

The screenshot shows a web-based configuration interface titled "ERPS Configuration". Below the title is a section labeled "ERPS CONFIGURE" enclosed in a red border. The configuration fields are as follows:

Protocol:	Disable ▼
Ring Port 0:	Port1 ▼
Role:	None ▼
Ring Port 1:	Port2 ▼
Role:	None ▼
Ring ID:	1
APS Channel:	1000
Revertive:	Yes ▼

An "Apply" button is located in the bottom right corner of the configuration area.

Figure 5.30 – RPL None Node Setup Example

5.5.3.2 Scenario B – Non-Configured Architecture

In some situations, users can choose not to configure the RPL owner and neighbor node. The ERPS can still work well under the mechanism by blocking one of the ring ports in the ERPS ring topology.

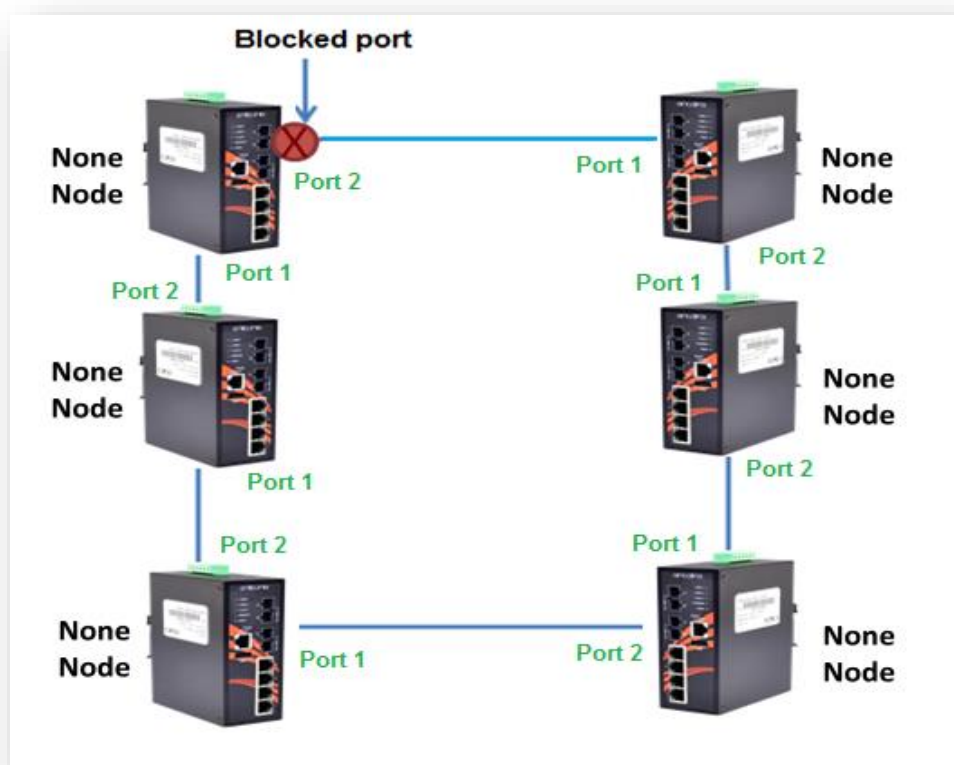

Figure 5.31 – Non-Configured Architecture

Caution: Before enabling any ERPS protocols on any of the Ring Nodes, please DO NOT connect all switches to form a loop (ring) network yet. There should have at least one ring port leave unplugged until all nodes in the topology are ready.

Shown above in Figure 5.31, the ERPS is blocked at one of the ring node ports. The blocked port is chosen by an election mechanism that is decided by the MAC address. Due to the MAC address is unique; the ERPS will just choose the biggest MAC as the blocking node. However, the user is still required to enable the RRPS protocol, and assign a dedicated port number for each uplink port under “Ring Port 0 and 1” but there is no requirement to setting the role. Figure 5.32, below, shows the configurations as a reference.

After the configurations, press the “Apply” button on the bottom right corner to save the settings.

Protocol:	Disable ▼
Ring Port 0:	Port1 ▼
Role:	None ▼
Ring Port 1:	Port2 ▼
Role:	None ▼
Ring ID:	1
APS Channel:	1000
Revertive:	Yes ▼

Apply

Figure 5.32 – Non-Configured Architecture Setup

5.6 Spanning Tree

The Spanning Tree Protocol (STP), defined in the IEEE Standard 802.1d, can be created within a mesh network of connected layer-2 switches.

The Rapid Spanning Tree Protocol (RSTP), defined in the IEEE 802.1w. RSTP is an enhanced solution of STP. It shares most of its basic operation characteristics, and essentially creates a cascading effect away from the root bridge where each designated bridge proposes to its neighbors to determine if it can make a rapid transition.

Another extension of RSTP is the Multiple Spanning Tree protocol (MSTP), defined in the IEEE802.1s. It allows different VLANs to travel along separate instances of spanning tree. Unlike STP and RSTP, MSTP eliminates the needs for having different STP for each VLAN. Therefore, in a large networking environment that employs many VLANs, MSTP can be more useful than legacy STP.

5.6.1 RSTP Status

Figure 5.33 shows the RSTP algorithm results.

RSTP/CIST Status

ROOT STATUS

Bridge ID:	8.000.7C:CB:0D:FF:FF:00

Port6	0	128	True	Auto	False
Port7	0	128	True	Auto	False
Port8	0	128	True	Auto	False
Port9	0	128	True	Auto	False
Port10	0	128	True	Auto	False
Port11	0	128	True	Auto	False
Port12	0	128	True	Auto	False

Figure 5.34 – RSTP Configuration Interface

Terms	Value Description
Mode	Users can select RSTP or MSTP function to be enabled or disabled before configuring the related parameters.
Root Priority (0~61440)	A value used to identify the root bridge. The bridge with the lowest value has the highest priority and is selected as the root. If any change of the value, the switch is required to be reboot. The value must be multiple of 4096 according to the protocol standard rule.
Root Hello Time (1~10)	Enter a value between 1 through 10 for the time to control the switch to send out the BPDU packet for RSTP current status checking.
Root Forward Delay (4~30)	Enter a value between 4 through 30 as the number of seconds for a port to wait before changing from its RSTP learning and listening states to the forwarding state.
Root Maximum Age (6~40)	Enter a value between 6 through 40 as the number of seconds a bridge waits without receiving STP configuration messages before attempting a reconfiguration.
Path Cost (0~200000000)	Enter a value from 1 through 200000000 to define the path cost for the other switch from this transmitting switch at the specified port. When path cost insert in 0, the switches will be setup as automatic data transmitting.
Priority (0~240)	Enter a number 0 through 240 to decide which port should be blocked by priority in LAN. The value of priority must be the multiple of 16
Admin P2P	Some of the rapid state transactions that are possible within RSTP are dependent upon whether the port concerned can only be connected to exactly one other switch (i.e. It is served by a point-to-point LAN segment), or it can be connected to two or more switches (i.e. It is served by a shared medium LAN segment). This function allows the P2P status of the link to be manipulated administratively. True means P2P enabling. False means P2P disabling.
Auto Edge	The port is directly connected to end stations, and it cannot create bridging loop in the network. To configure the port as an edge port, set the port to " True ".

Admin Non STP	The port includes the STP mathematic calculation. True is not including STP mathematic calculation. False is including the STP mathematic calculation.
	Click the “Apply” button to save changes.

Figure 5.35 – RSTP Configuration Terms & Value Description

MSTP (Multiple Spanning Tree Protocol)

It is defined in IEEE 802.1s; it can map a group of VLAN’s into a single Multiple Spanning Tree instance (MSTI). In fact, the Spanning Tree Protocol is applied separately for a set of VLAN’s instead of the whole network. Different root switches and different STP parameters can be individually configured for each MSTI. So, one link can be active for one MSTI and the other link active for the second MSTI. This enables some degree of load-balancing and generally two MSTI’s are used in the network for easier implementation.

5.6.3 MSTI Status

Users can display the MSTI root status and port status by selecting the instance ID number from 1 to 15 by clicking on the dropdown box from the “MSTI Status” interface.

5.7 IGMP Snooping

The Internet Group Management Protocol (IGMP) is a communications protocol used to manage the membership of Internet Protocol multicast groups. IGMP is used by IP hosts and adjacent multicast routers to establish multicast group memberships.

When IGMP snooping is enabled in a switch, it analyzes all the IGMP packets between hosts connected to the switch and multicast routers in the network. When a switch receives an IGMP report for a given multicast group from a host, the switch adds the host's port number to the multicast list for that group. When the switch hears an IGMP leave, it removes the host's port from the table entry.

IGMP snooping can reduce multicast traffic from streaming and other bandwidth intensive IP applications more effectively. A switch using IGMP snooping will only forward multicast traffic to the hosts in that traffic. This reduction of multicast traffic reduces the packet processing at the switch (at the cost of needing additional memory to handle the multicast tables) and also decreases the workload at the end hosts since their network cards (or operating system) will not receive and filter all the multicast traffic generated in the network.

IGMP has 3 versions, IGMP v1, v2, and v3, and support query group up to 256 groups.

5.7.1 IGMP Settings

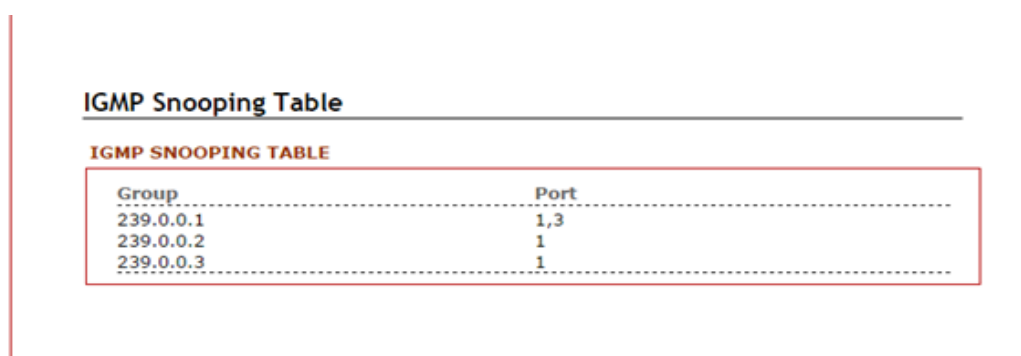

Figure 5.41 – IGMP Snooping Settings Interface

Terms	Value Description
IGMP Protocol	Check the box to enable or disable IGMP Snooping
Querier	Switch will be IGMP querier or not. There should have the existing one and only one IGMP querier in an IGMP application – up to 256 Groups
Query Interval	The frequency at which the querier sends query messages
Query Max Response Time	The maximum response time advertised.
Apply	Click the “Apply” button to save changes.

Figure 5.42 – IGMP Snooping Settings Terms & Value Description

5.7.2 IGMP Snooping Status Table

Multicast filtering is the system by which end stations only receive multicast traffic if they register to join specific multicast groups. With multicast filtering, network devices only forward multicast traffic to the ports that are connected to registered end stations.

The image shows a screenshot of a network switch's IGMP Snooping Table. The table is titled "IGMP SNOOPING TABLE" and has two columns: "Group" and "Port". The data rows are as follows:

Group	Port
239.0.0.1	1,3
239.0.0.2	1

5.8 802.1Q VLAN

A Virtual LAN (VLAN) is a logical network grouping that limits the broadcast domain, which allows users to isolate network traffic. Only the members of the VLAN will receive traffic from the same members on that VLAN. Basically, creating a VLAN from a switch is logically equivalent of reconnecting a group of network devices to another Layer 2 switch. However, all the network devices are still physically plugged into the same switch.

All Antaira's industrial managed switches support 802.1Q VLAN. Tagged-based VLAN is an IEEE 802.1Q specification standard, and it is possible to create a VLAN across devices from different switch vendors. IEEE 802.1Q VLAN uses a technique to insert a "tag" into the Ethernet frames. Tag contains a VLAN Identifier (VID) that indicates the VLAN numbers.

The managed switches also provide users with a defined management VLAN, so that users can connect an Antaira switch to other "commercial" switches that have existed and set a non VLAN 1 management VLAN.

5.8.1 802.1Q VLAN Settings

All of Antaira's industrial managed switches' have a default VLAN 1 setting set to "Untag" for each port, so the users can login to the VLAN setting interface to create a VLAN Group name and choose "Tag" or "Untag" for each port.

802.1Q VLAN

5.9 QoS (Traffic Prioritization)

Network traffic is always unpredictable and the only basic assurance that can be offered is the best effort traffic delivery. To overcome this challenge, Quality of Service (QoS) is applied throughout the network. This ensures that network traffic is prioritized according to specified criteria and receives preferential treatments.

Traffic Prioritization includes three modes: port base, 802.1p/COS, and TOS/DSCP. By traffic prioritization function, users can classify the traffic into four classes for differential network application. All of Antaira’s industrial managed switches support four priority queues.

5.9.1 QoS Classification

Qos Classification

QoS CLASSIFICATION

Queue Scheduling	Weighted ▼

Figure 5.51 – QoS Mapping Terms & Value Description

5.9.3 ToS Mapping

ToS is an acronym for Type of Service. It is implemented as the IPv4 ToS priority control. It is fully decoded to determine the priority from the 6-bit ToS field in the IP header. The most significant 6 bits of the ToS field are fully decoded into 64 possibilities, and the singular code that results is compared against the corresponding bit in the IPv4 ToS priority control bit (0~63).

ToS Mapping

5.10 Port Trunk

Port Trunk, also called “Link Aggregation”, is a method of combining multiple network connections in parallel. It is to increase throughput beyond what a single connection could sustain. For example, if the application requires a 5-Gigabit link, and each port supports only 1-Gigabit link, the “Port Trunk” allows users to link 5 of 1-Gigabit ports to obtain a 5-Gigabit trunk feature. All Antaira’s industrial managed switches support 2 types of Port Trunk. One is LACP (dynamic) and the other is Static.

- LACP mode is more flexible, and it can change modes, either trunk or single port.
- Dynamic Port Trunk also provides a redundancy function, in case one of the links fail. If one of the trunk members has failed, it will still work well in LACP mode, but it will link down if using static mode. Static mode is still necessary, because some devices only support static trunk.

5.10.1 Trunk Status

The below graph is the Port Trunk Status.

Trunk Status		
AGGREGATION		
Group	Type	Port
1	lacp	1,2
2	-	-
3	-	-
4	lacp	3,5,6
5	-	-

5.12 SNMP

Simple Network Management Protocol (SNMP) is the protocol developed to manage nodes (servers, workstations, routers, switches and hubs etc.) on an IP network. SNMP enables network administrators to manage network performance, find and solve network problems, and plan for network growth. Network management systems learn of problems by receiving traps or change notices from network devices implementing SNMP.

5.12.1 SNMP Agent

SNMP Agent

SNMP GENERAL(Invalid Chars #\'"?, max length:32)

SNMP Version:	v1 , v2c , v3 ▼
Read-Only Community	public
Read and Write Community	private

Encrypt Passphrase 
User Auth level:	Auth-only ▼
User Auth Type:	SHA ▼
Auth Passphrase 
User Data Encrypt Type:	AES ▼
Encrypt Passphrase 

Figure 5.60 – SNMP Agent Setup Interface

SNMP General -

Terms	Value Description
SNMP Version	All Antaira Managed Switches support SNMP v1, v2c, and v3 server. Users can enable all SNMP server v1, v2c and v3, or enable only v1 and v2c, or enable only enable v3. Default SNMP server is enabled, set version to “None” to disable it.
Read-Only Community	Using “Read-Only Community” on the SNMP MIB walk utility can only read information. The maximum length of Read-Only Community is 32 characters and #, \, ‘, “, ? are invalid characters.
Read and Write Community	Using “Read and write Community” on the SNMP MIB walk utility not only can read information, but can write/edit part of information. The maximum length of Read-Only Community is 32 characters and #, \, ‘, “, ? are invalid characters.
	Click the “Apply” button to save changes.

SNMP V3 -

There are 2 accounts when using SNMP v3 authentication. These 2 accounts are “admin” and “user”. In this section, it introduces the authentication settings and encryption information.

Terms	Value Description
Admin Auth Level	“Auth-only” means only do authentication but not encrypt data. “Both” means both do authentication and encrypt data. “None” means not do authentication and not encrypt data.
Admin Auth Type	The method used to encrypt the passphrase
Auth Passphrase	“Auth Passphrase” is a string used to authenticate (Admin). The range of length is from 8 to 32 characters with only numeric and alphabet characters accepted.
Admin Data Encrypt Type	The method used to encrypt the data.
Encrypt Passphrase	“Encrypt Passphrase” is a string used to encrypt data (Admin). The range of length is from 8 to 32 characters with only numeric and alphabet characters accepted.
User Auth Level	“Auth-only” means only do authentication but not encrypt data. “Both” means both do authentication and encrypt data. “None” means not do authentication and not encrypt data.

User Auth Type	The method used to encrypt the passphrase
Auth Passphrase	“Auth Passphrase” is a string used to authenticate (User). The range of length is from 8 to 32 characters with only numeric and alphabet characters accepted.
User Data Encrypt Type	The method used to encrypt the data.
Encrypt Passphrase	“Encrypt Passphrase” is a string used to encrypt data (User). The range of length is from 8 to 32 characters with only numeric and alphabet characters accepted.
	Click the “Apply” button to save changes.

5.12.2 SNMP Trap Setting

Trap Setting

SNMP

Trap Mode:	<input type="text" value="None"/>
Inform Retry:	<input type="text" value="10"/>
Inform Timeout:	<input type="text" value="30"/>
Trap Destination IP:	<input type="text"/>
Community:	<input type="text" value="public"/>

Figure 5.62 – SNMP Trap Setting

Terms	Value Description
Trap Mode	SNMP Trap is disabled (set to “None”) by default. Users can set it to “Trap v1”, “Trap v2c”, or “Inform (v2c)”. If users set it to “Trap”, the trap message will only send once, but if set the mode to “Inform”, the trap message will send “Inform Retry” times.
Inform Retry	The trap message will be sent “Inform Retry” times. This field works only when “Trap Mode” is set to “Inform”.

Inform Timeout	The trap message will be sent after “Inform Timeout” expired. This field works only when “Trap Mode” is set to “Inform”.
Trap Destination IP	The Destination IP that trap message will be sent to.
	Click the “Apply” button to save changes.

Figure 5.63 – SNMP Trap Settings Terms & Value Description

5.13 DHCP Server / Rely

DHCP Client & Server

Dynamic Host Configuration Protocol (DHCP) is a standardized network protocol. It is used on Internet Protocol (IP) networks for dynamically distributing network configuration parameters. For example, devices can request IP addresses for interfaces from a DHCP server. Using DHCP can also reduce the need for a network administrator or a user to configure these settings manually.

The protocol operates based on the client-server model. When DHCP Clients connect to a network, they will send a broadcast query to request necessary information from a DHCP server. DHCP Servers manage a pool of IP address and network configuration information. If they get queries from DHCP Clients, they will automatically distribute IP address and network parameters to them.

DHCP Relay Agent

DHCP Relay Agents help DHCP Clients forwarding request to DHCP Servers. With DHCP Relay Agents, DHCP Servers and Clients will not know each other. A Relay Agent can connect to more than 1 DHCP Server, so that DHCP Clients will have more resources.

DHCP Relay Option 82

Users can also use the information of DHCP Relay Option 82 to distribute IP address. Antaira’s industrial managed switches provides “Cisco-like” Option 82 format. It contains Circuit ID and Remote ID. The packets format of Circuit ID and Remote ID are shown as below Figure 5.64 and Figure 5.66; and the detail of packet fields are in Figure 5.65 and Figure 5.67. The IP addresses will get more controllable with DHCP Relay Option 82 function.

Figure 5.64 – DHCP Relay Option 82 Circuit ID

Field	Description
VLAN	The management VLAN ID. Always VLAN 1.
Module	The stack number. Always 0 here.
Port	It is the incoming port number from DHCP Client, and the port number is started by 1.

Figure 5.65 – DHCP Relay Option 82 Circuit ID Details

Figure 5.66 – DHCP Relay Option 82 remote ID

Field	Description
MAC Address	The MAC address of the Relay Agent. The MAC address is all hex format and without “.” or “-”, for example, “7CCB0AC49B2D”.

Figure 5.67 – DHCP Relay Option 82 Remote ID Details

5.13.1 DHCP Client

The below figure is the IP Setting of DHCP Client.

5.14 802.1X

802.1X is an IEEE Standard for Port-based Network Access Control. It provides an authentication mechanism to devices that wish to attach to a LAN or WLAN. This port-based network access control protocol contains 3 parts, supplicant, authenticator, and authentication server. With 802.1X authentication, we can link a username with an IP address, MAC address, and port. This provides greater visibility into the network. 802.1X also provides more security because it only allows traffic transmitting on authenticated ports or MAC addresses. Although the IEEE standard defined it as a "Port-based" control, to provide more robust service, Antaira implements all managed switches with 802.1X to a "MAC-based" access control.

RADIUS

RADIUS is used in the authentication process. Database of authorized users is maintained on a RADIUS server. There is an authenticator, our switch enabling 802.1X, to forward the authentication requests between authentication (RADIUS) server and client. Allowing or denying the requests decides if the client can connect to a LAN/WAN or not.

5.14.1 802.1X Settings

The below figure is the 802.1X configuration interface.

802.1X

802.1X

802.1X Enable:

Server Type:

802.1X PORT

Figure 5.81 – RADIUS Server Setting Interface

The below table describes RADIUS Server Terms and Value Description.

Terms	Value Description
Server IP	IP Address of RADIUS server
Server Port	“Server Port” default value is 1812. Switch will communicate with RADIUS server via this port.
Server Shared Key	Shared key is used to authenticate authenticator (switch) and authentication (RADIUS) server. Click “  ” icon to show the shared key.

Figure 5.82 – RADIUS Server – Terms & Value Description

5.15 UPnP

Universal Plug and Play (UPnP) is a set of networking protocols that were promoted by the UPnP Forum. UPnP Protocol permits networked devices to discover each other's presence on the network and seamlessly establish functional network services for data sharing, communications, and entertainment.

The concept of UPnP is an extension of plug-and-play, a technology for dynamically attaching devices directly to a computer. But UPnP is not directly related to the earlier plug-and-play technology any more. UPnP devices are "plug-and-play" in that when connected to a network they automatically establish working configurations with other devices.

5.15.1 UPnP

Below, *Figure 5.83*, is the UPnP web interface.

UPnP

UPnP (Interval: 300 - 86400 sec)

UPnP Enable:

UPnP Advertisement Interval (sec):

Figure 5.83 – UPnP Configuration Interface

Terms	Value Description
UPnP Enable	"Enable" or "Disable" UPnP protocol
UPnP Interval	UPnP Interval is the setting of Advertisement interval. It controls the time of sending advertisement. The advertisement interval is from 300 to 86400 seconds.

Figure 5.84 – UPnP Terms and Value Description

5.16 Modbus TCP

Modbus is a serial communications protocol that is used with industrial automation equipment, such as programmable logic controllers (PLCs), sensors, and meters. It is a common, simple, and robust method of connecting industrial devices.

MODBUS TCP is a variant of the MODBUS family, vendor-neutral communication protocol commonly used for the integration of a SCADA system; of which, it covers the use of MODBUS messaging in an 'intranet' or 'internet' environment using the TCP/IP protocols.

According to the standard, Modbus encapsulates the message with an Ethernet TCP/IP wrapper. Antaira's industrial Managed Ethernet switches support Modbus TCP/IP protocol to allow users to integrate it into those industrial control systems for real-time monitoring in a SCADA system.

5.16.1 Enable Modbus TCP

Below, *Figure 5.85*, is the ModbusTCP web interface.

The screenshot shows a web interface section titled 'Modbus'. Below the title, there is a red-bordered box containing the text 'Modbus Tcp Enable:' followed by an unchecked checkbox. To the right of the checkbox is an 'Apply' button.

Figure 5.85 – Modbus TCP Web Interface

The below table describes Modbus Terms and Value Description.

Terms	Value Description
Modbus TCP Enable	Check the checkbox to enable Modbus TCP.

Figure 5.86 – Modbus TCP – Terms & Value Description

5.16.2 MODBUS Data Map and Information

The data map addresses for Antaira's switches are shown in the table for **Function Code 6**.

Address Offset	Data Type	Interpretation	Description
System Information			
0x0000 to 0x0005	1 word	HEX	Port 1 to 6 Status 0x0000 : Link down 0x0001 : Enable 0x0002 : Disable

			Port 1 to 6 Status Configuration 0x0001 : Enable 0x0002 : Disable
--	--	--	---

The data map addresses for Antaira's switches are shown in the following table starting from MODBUS for Function Code 4. For example, the address offset 0x0000 (hex) equals MODBUS address 30001, and the address offset 0x0015 (hex) equals MODBUS address 30022. Note that all the information read from Antaira switches are in hex mode. To interpret the information, refer to the ASCII table for the translation (e.g. 0x41 = 'A', 0x6E = 'n').

Address Offset	Data Type	Interpretation	Description
System Information			
0x0000	1 word	HEX	Vendor ID = 0x0000
0x0001	1 word		Unit ID (Ethernet = 1)
0x0002	1 word	HEX	Product Code = 0x0000
0x0010	20 words	ASCII	Vendor Name = "Antaira" Word 0 Hi byte = 'A' Word 0 Lo byte = 'n' Word 1 Hi byte = 't' Word 1 Lo byte = 'a' Word 2 Hi byte = 'i' Word 2 Lo byte = 'r' Word 3 Hi byte = 'a' Word 3 Lo byte = '\0'
0x0030	20 words	ASCII	Product Name = "LMP-1202G-SFP" Word 0 Hi byte = 'L' Word 0 Lo byte = 'M' Word 1 Hi byte = 'P' Word 1 Lo byte = '-' Word 2 Hi byte = '0' Word 2 Lo byte = '6' Word 3 Hi byte = '0' Word 3 Lo byte = '2' Word 4 Hi byte = '\0' Word 4 Lo byte = '\0'
0x0050	1 word		Product Serial Number

0x0051	2 words	HEX	Firmware Version For example : Word 0 = 0 x 0203 Word 1 = 0 x 0300 Firmware Version was 2.3.3
0x0053	2 words	HEX	Firmware Release Date For example : Word 0 = 0 x 2319 Word 1 = 0 x 1501 Firmware was released on 2015-01-23 at 19:00
0x0055	3 words	HEX	Ethernet MAC Address Ex : MAC = 7C:CB:0D:AD:DC:14 Word 0 Hi byte = 0 x 7C Word 0 Lo byte = 0 x CB Word 1 Hi byte = 0 x 0D Word 1 Lo byte = 0 x AD Word 2 Hi byte = 0 x DC Word 2 Lo byte = 0 x 14
0x0058	1 word	HEX	Power 1 0x0000 : Off 0x0001 : On
0x0059	1 word	HEX	Power 2 0x0000 : Off 0x0001 : On
0x005A	1 word	HEX	Fault LED Status 0x0000 : Boot error 0x0001 : Normal 0x0002 : Fault
0x0082	1 word	HEX	DO1 0x0001 : Normal 0x0002 : Fault
Port Information			
0x1000 to 0x1005	1 word	HEX	Port 1 to 6 Status 0x0000 : Link down 0x0001 : Link up

			0x0002 : Disable 0xFFFF : No port
0x1100 to 0x1105	1 word	HEX	Port 1 to 6 Speed 0x0000 : 10M-Half 0x0001 : 10M-Full 0x0002 : 100M-Half 0x0003 : 100M-Full 0xFFFF : No port
0x1200 to 0x1205	1 word	HEX	Port 1 to 6 Flow Ctrl 0x0000 : Off 0x0001 : On 0xFFFF : No port
0x1300 to 0x1305	1 word	HEX	Port 1 to 6 MDI/MDIX 0x0000: MDI 0x0001: MDIX 0xFFFF: No port
0x1400 to 0x1413 (Port 1) 0x1414 to 0x1427 (Port 2)	20 words	ASCII	Port 1 to 6 Name Port Name = "100FDX,RJ45." Word 0 Hi byte = '1' Word 0 Lo byte = '0' Word 1 Hi byte = '0' Word 1 Lo byte = 'F' ... Word 5 Hi byte = '5' Word 5 Lo byte = '.'

Figure 5.87 – Antaira Switches – Modbus Data Map & Information

5.17 System Warning

System warning function is very important for managing a switch. Users can manage the switch by “Syslog”, “System Event Log”, and “Email Server” setup for Advanced Notice in any event type, “Event Type Selection”, and “Fault Alarm” setting. By setting up all these system warning features, users will receive the in advanced warning message through email, whenever any event occurs. It definitely increases the flexibility and capability for the user to monitor the remote site network and device statuses.

5.17.1 Syslog Setting

The SYSLOG is a protocol to transmit event notification messages across networks.

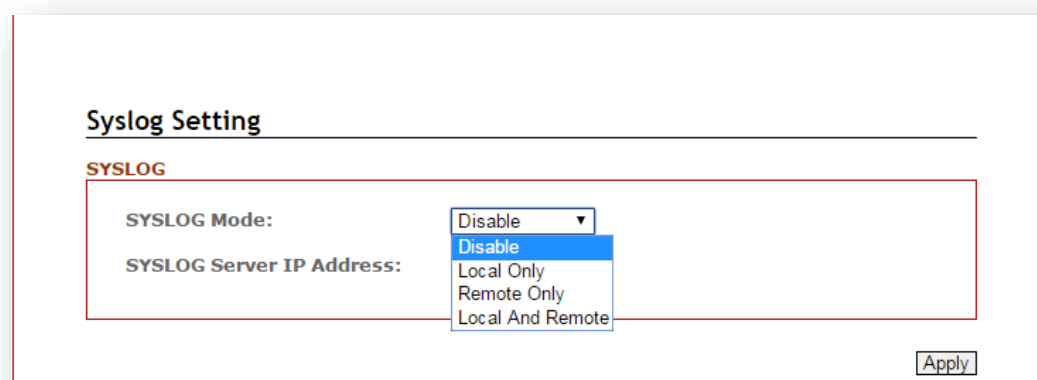

Figure 5.88 – Syslog Setting

Terms	Value Description
SYSLOG Mode	Disable: disable SYSLOG. Local Only: log to local system. Remote Only: log to a remote SYSLOG server.

	Local And Remote: log to local server and remote SYSLOG server at the same time.
SYSLOG Server IP Address	Insert remote SYSLOG server IP address
	Click the “Apply” button to save changes.

Figure 5.89 – SYSLOG Setting Terms & Value Description

5.17.2 System Event Log

Users can view and display the system event log by clicking the “Apply” button on the right bottom corner of the interface. Then, the system event logs will display within the SYSLOG LIST window. The SYSLOG LIST will contain up to 5 pages of system event log information. Users also can click the “Refresh” button to have the most updated system event logs information to display.

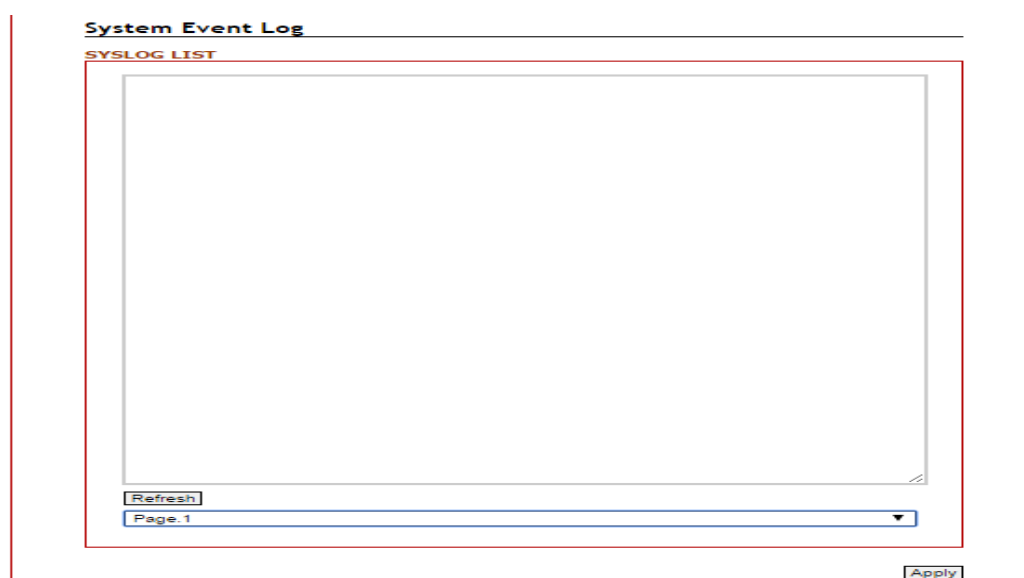

Figure 5.90 – System Event Logs Interface

5.17.3 SMTP Setting

The Simple Mail Transfer Protocol (SMTP) is for e-mail transmission across the Internet.

Figure 5.91 – SMTP Setting Interface

Terms	Value Description
E-mail Alert	Enable/Disable transmission system warning events by e-mail.
SMTP Server Address	Setting up the mail server IP address
Sender E-mail Address	Set up the email account to send the alert.
Mail Subject	The subject of the mail
Authentication	Check the box to enable the Authentication function Username: the authentication username. Password: the authentication password.
Recipient E-mail Address(es)	Users can setup up to 4 recipient E-mail addresses to receive any system warning message.
Apply	Click the “Apply” button to save changes.

Figure 5.92 – SMTP Setting Terms & Value Description

5.17.4 Event Selection

Users can select any event type through the “Event Selection” interface, such as “System Cold Start”, any ports’ “Link Up”, “Link Down”, “Link Up & Link Down” and send the system warning message to either SYSLOG or SMTP, or both at the same time. After the event selection, users can click the “Apply” button to save changes.

Figure 5.93 – Event Selection Setting Interface

5.17.5 Fault Alarm

When any selected fault event has occurred, the fault LED of the switch’s front panel will light up and the electric relay will signal at the same time. Users can check the checkbox of any “Fault Alarm” type, such as power failure, port link down or broken through the “Fault Alarm” setting interface to trigger this function.

5.18 MAC Table

The MAC address table is the filtering database that supports queries by the forwarding process, as to whether a frame received by a given port with a given destination MAC address is to be forwarded through a given potential transmission port.

5.18.1 MAC Address Table

MAC Address Table

Figure 5.95 – MAC Address Table Interface

5.18.2 MAC Table Configuration

Users can check the checked box of each port and insert the port's VID and MAC address of the device that is connected to that port, then click the "Add" button to continue adding other ports' information. Click the "Apply" button to save all the settings.

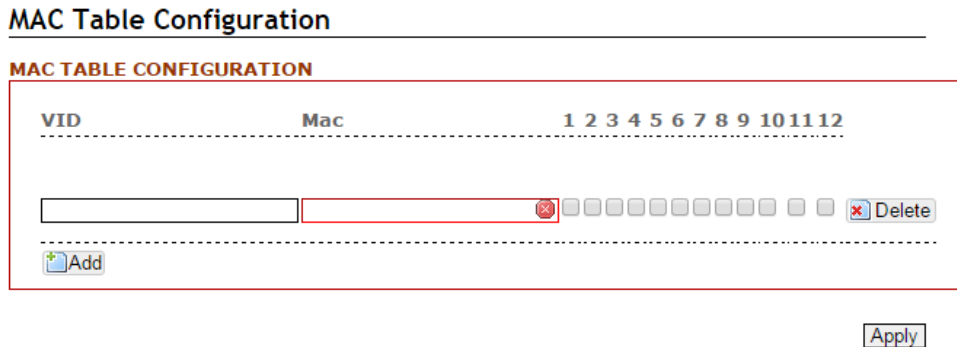

Figure 5.96 – MAC Table Setting Interface

5.19 Maintenance

Under the maintenance section, users can execute to the updated firmware upgrade, system reboot, and reset the system to factory default.

5.19.1 Upgrade

Antaira is continuously developing new functions and features for specific application requirements for the industrial managed switches. Users can download the latest firmware from Antaira's website and store it within their local PC, or server.

Figure 5.97 – Firmware Upgrade Interface

Terms	Value Description
FIRMWARE UPGRADE	Users can click the "Choose File" button to select the latest firmware from the local PC, or Server; then click the "Upgrade" button to have the switch be updated.

Figure 5.98 – Firmware Upgrade Setting Terms & Value Description

5.19.2 Reboot

Users can click the “Apply” button under the “Reboot” interface to reboot the switch.

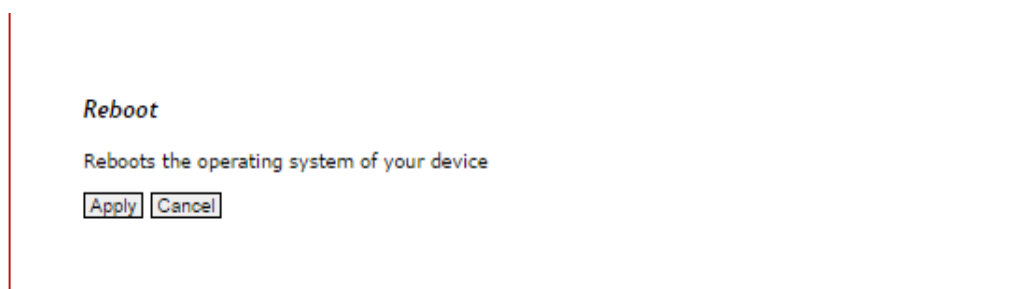

Figure 5.99 – Switch Reboot Interface

5.19.3 Default

Users can reset the switch to “Factory Default” by clicking the “Apply” button under the default interface.

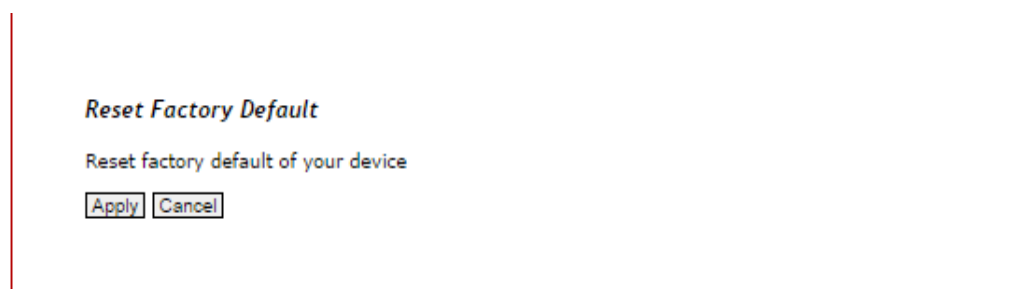

Figure 5.100 – Reset Factory Default Interface

5.20 Configuration

Under the “Configuration” section, users can save all the settings that have been configured, backed up and stored to a local PC, Server, or a USB storage device through the built-in USB port.

Users can use the USB port feature to execute the “Auto Load” function to boot the switch’s configuration that has been saved within the USB storage device, or users can utilize this function to “Auto Load” the configuration to other switches, and those switches would require the same configuration settings.

Users can keep the USB storage device plugged in with the switch to enable the USB “Auto Backup” function to allow the switch’s configuration settings to back up to the USB storage device whenever users makes and save configuration settings.

5.20.1 Save

Users can click the “Save” button under the “SAVE CONFIGURATION” interface, once all the settings had been configured.

Figure 5.101 – Save Setting Interface

5.20.2 Backup & Restore

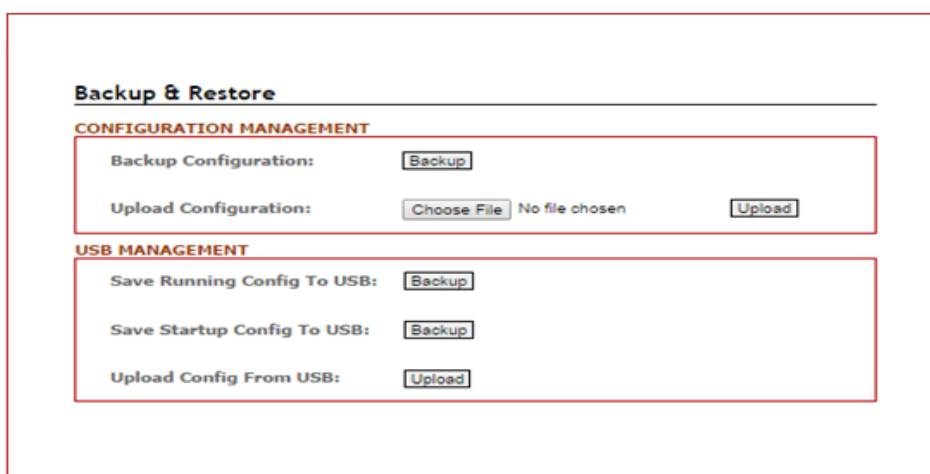

Figure 5.102 – Backup & Restore Setting Interface

Terms	Value Description
CONFIGURATION MANAGEMNET	
Backup Configuration	By clicking the “Backup” button, it allows users to back up the switch configuration setting to their local PC, or server.
Upload Configuration	Users can click the “Choose File” button to select the saved configuration file from local PC, or server, then click the “Upload” the settings to the switch.
USB Management	
Save Running Config to USB	Click the button of Backup to save running-config file to USB.
Save Startup Config to USB	Click the button of Backup to save startup-config file to USB.
Upload Config from USB	Click the button of Upload to load startup-config from USB.

Figure 5.103 – Backup & Restore Setting Terms & Value Description

5.20.3 Auto Load & Backup

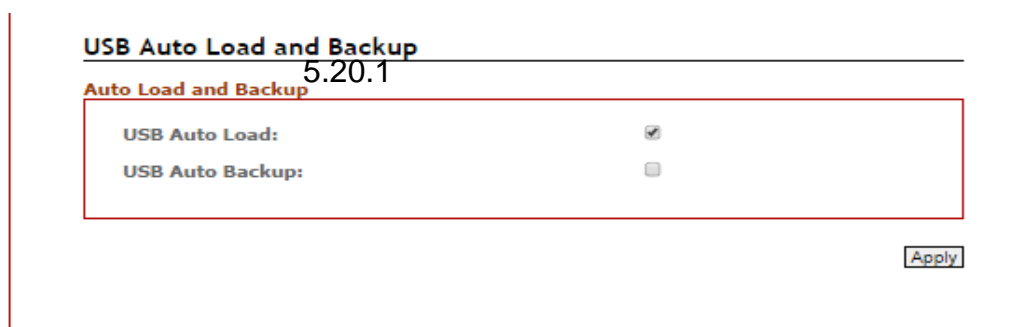

Figure 5.104 – USB Auto Load and Backup Setting Interface

Terms	Value Description
USB Auto Load	Select USB Auto Load (plug USB stick and reboot the switch), it will auto load startup file from USB to Switch. Please make sure the startup file name is “switch- [MAC ADDRESS].cfg”, if the file didn’t exist, it will find “switch-config.cfg”. If all of them didn’t exist, it does not work.
USB Auto Backup	Select USB Auto Backup, it can auto Backup running-config file from Switch to USB. And the file name is “startup-config”.

Figure 5.105 – USB Auto Load and Backup Setting Terms & Value Description

5.21 Logout

Users can logout of the web console interface by clicking ‘logout’ from the menu.

6. Command Line Interface Management

6.1 About CLI Management

Besides WEB-based management, LMP-1202G-SFP series also supports CLI management. Users can use console or telnet to management switch by CLI.

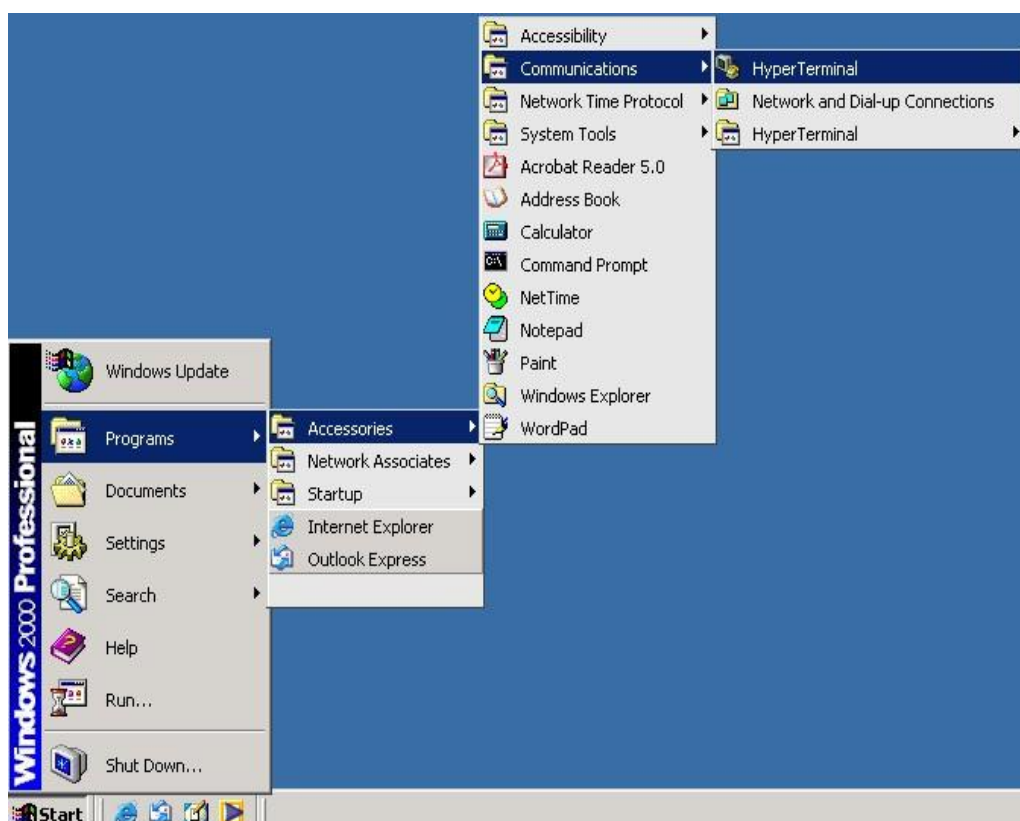

CLI Management by RS-232 Serial Console (115200, 8, none, 1, none)

Before configuring by an RS-232 serial console, use an RJ45 to DB9-F cable to connect the switches' RS-232 Console port to the PC's COM port.

Follow the steps below to access the console via RS-232 serial cable.

Step 1:

From the Windows desktop, click on Start -> Programs -> Accessories -> Communications -> Hyper Terminal.

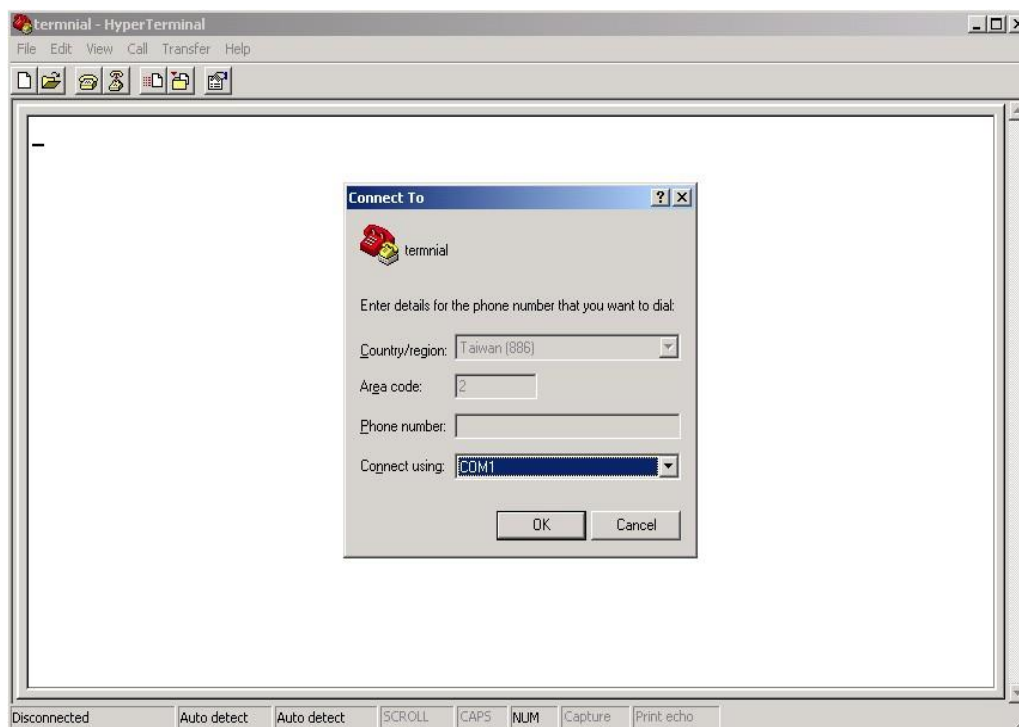

Step 2:

Input a name for the new connection.

Step 3:

Select to use a specific COM port number.

Step 4:

The COM port property settings are as follows: 115200 for “Bits per second”, 8 for “Data bits”, None for Parity, 1 for “Stop bits” and none for “Flow control”.

Step 5:

The Console login screen will appear. Use the keyboard to enter the Username and Password, and then press “Enter”.

CLI Management by Telnet

Users can use “TELNET” to configure the switches.

The default value is as below:

- IP Address: **192.168.1.254**
- Subnet Mask: **255.255.255.0**
- Default Gateway: none
- User Name: **admin**
- Password: **admin**

Follow the steps below to access the console via Telnet.

Step 1:

Telnet to the IP address of the switch from the Windows “Run” command as below.

Step 2:

The Login screen will appear. Use the keyboard to enter the Username and Password, and then press “Enter”

```
User Access Verification

Username: admin
Password:

SWES> en

SWES# configure terminal
```

Save and Load Configuration File to/from USB

1. CLI: enable -> configure terminal ->copy running-config usb (path)

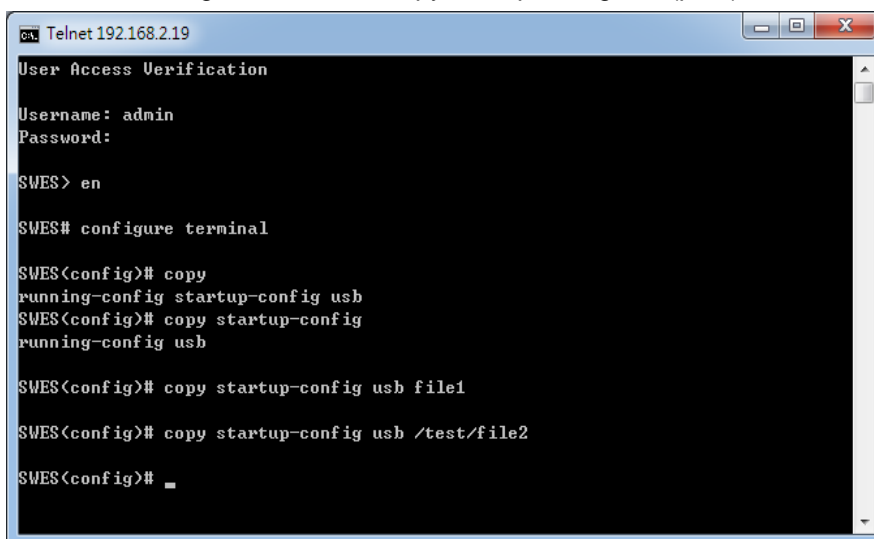

```
ca. Telnet 192.168.2.19
User Access Verification
Username: admin
Password:
SWES> en
SWES# configure terminal
SWES(config)# copy
running-config startup-config usb
SWES(config)# copy running-config
startup-config usb
SWES(config)# copy running-config usb file1
SWES(config)# copy running-config usb /test/file2
SWES(config)# _
```

Fill in the folder and filename behind the “copy running-config usb” command.

Ex: file1, / folder /file2.

2. CLI : enable -> configure terminal ->copy startup-config usb (path)

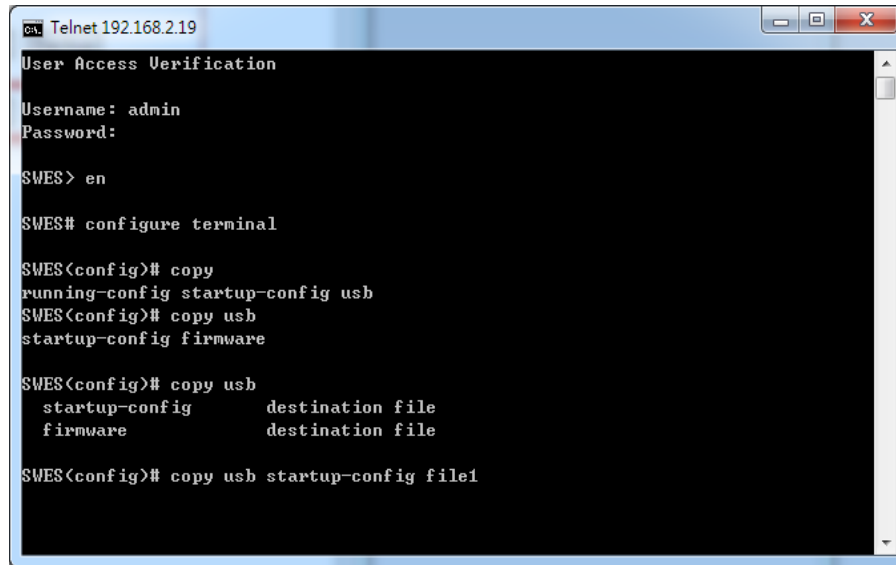

```
ca. Telnet 192.168.2.19
User Access Verification
Username: admin
Password:
SWES> en
SWES# configure terminal
SWES(config)# copy
running-config startup-config usb
SWES(config)# copy startup-config
running-config usb
SWES(config)# copy startup-config usb file1
SWES(config)# copy startup-config usb /test/file2
SWES(config)# _
```

Fill in the folder and filename behind the “copy startup-config usb” command.

Ex: file1, / folder /file2.

3. CLI :enable -> configure terminal ->copy usb startup-config (path)

```
ca. Telnet 192.168.2.19
User Access Verification
Username: admin
Password:

SWES> en

SWES# configure terminal

SWES(config)# copy
running-config startup-config usb
SWES(config)# copy usb
startup-config firmware

SWES(config)# copy usb
startup-config destination file
firmware destination file

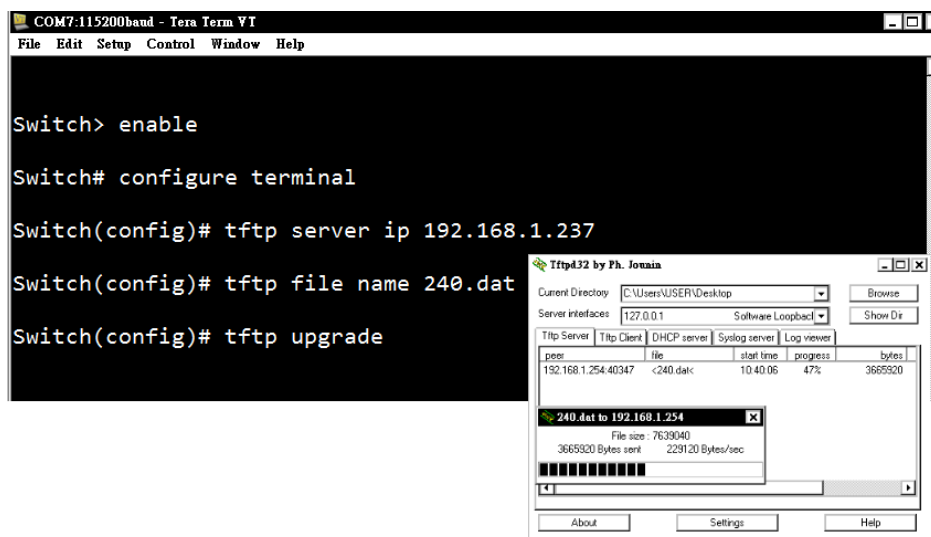

SWES(config)# copy usb startup-config file1
```

Fill in the folder and filename behind the “copy usb startup-config” command.

Ex: file1, / folder /file2.

Upgrade via TFTP

CLI : enable -> configure terminal ->tftp server ip [IP_ADDRESS] ->tftp file name [UPGRADE_FILE_NAME] ->tftp upgrade

```
COM7:115200baud - Tera Term VT
File Edit Setup Control Window Help

Switch> enable

Switch# configure terminal

Switch(config)# tftp server ip 192.168.1.237

Switch(config)# tftp file name 240.dat

Switch(config)# tftp upgrade
```

Tftp Server	Tftp Client	DHCP server	Sylog server	Log viewer	
peer	file	start time	progress	bytes	
192.168.1.254	40347	<240.dat	10.40.06	47%	3665920

240.dat to 192.168.1.254
File size: 7639040
3665920 Bytes sent 2291.20 Bytes/sec

Fill in the TFTP server IP and upgrade file name behind the “tftp server ip [IP_ADDRESS]” and “tftp file name [UPGRADE_FILE_NAME]”

7. Technical Specifications

Table 7.1 has the technical specifications for Antaira's LMP-1202G-SFP series: 12-port industrial gigabit PoE+ managed Ethernet switch with 8*10/100/1000Tx (PSE: 30W/Port), 2*10/100/1000Tx (Non-PoE Ports) and 2*100/1000 SFP slots.

Standards	IEEE 802.3	10Base-T 10Mbit/s Ethernet
	IEEE 802.3u	100Base-Tx, 100Base-Fx, Fast Ethernet
	IEEE 802.3ab	1000Base-Tx Gigabit Ethernet
	IEEE 802.3z	Gigabit Fiber
	IEEE 802.3x	Flow Control for Full Duplex
	IEEE 8023.af	Power-over-Ethernet
	IEEE 802.3at	Power-over-Ethernet Plus (Enhanced)
	IEEE 802.3ad	Port Trunking with LACP
	IEEE 802.1d	STP (Spanning Tree Protocol)
	IEEE 802.1w	RSTP (Rapid Spanning Tree Protocol)
	IEEE 802.1s	MTP (Multiple Spanning Tree Protocol)
	ITU-TG.8032 / Y.1344	ERPS (Ethernet Ring Protection Switch)
	IEEE 802.1q	Virtual LANs (VLAN)
	IEEE 802.1x	Port based Network Control, Authentication
	IEEE 802.1ad	Stacked VLAN, Q-in-Q
IEEE 802.1p	QoS/CoS Protocol for Traffic Prioritization	
Switch	Protocol	IGMPv1/v2, SNMPv1/v2c/v3, TFTP, SNTP, SMTP, RMON, HTTP, HTTPS, Telnet, Syslog, DHCP Option 66/67/82, SSH/SSL, Modbus/TCP, LLDP, IPv4/IPv6
	Data Process	Store and Forward
	Transfer Rate	14,880 pps for 10Base-Tx Ethernet port 148,800 pps for 100Base-TX Fast Ethernet port 1,488,000pps for 1000Base-TxGigabit Ethernet port
	Packet Buffer	4 Mbits
	MAC Table	8K
	Jumbo Frame	9.6k
	Flow Control	IEEE 802.3x-full duplex mode, back pressure-half duplex mode
	VLAN Groups	1 ~ 4094
	IGMP Groups	Up to 256
Port Interface	Ethernet (RJ45) Port	8*10/100/1000BaseTx (PSE: 30W/Port), 2*10/100/1000Tx (Non-PoE Ports) auto negotiation speed, Full/Half duplex mode, and auto MDI connection
	Fiber Connections	2*100/1000 Dual rate SFP fiber slots

	PoE Pin Assignment	V+, V+, V-, V-, for pin 1, 2, 3, 6 (Endspan, MDI Alternative A)
	Serial Console Port	1*RS232 in RJ45 connector with console cable, 115.2Kbps, 8,N,1
	Configuration Backup Port	1*USB 2.0
Protection	Overload Current	Present
	Power Reverse polarity	Present
	CPU Watch Dog	Present
	Network Cable	10Base-T: 2-pair UTP/STP Cat. 3, 4, 5 cable; 100Base-TX: 2-pair UTP/STP Cat. 5 cable. EIA/TIA-568 100-ohm (100m) 1000BaseTX: UTP/STP Cat.5/5E cable; EIA/TIA-568 100-ohm (100m)
Mechanical Characteristics	LED Indicator	Power Unit: P1 (Green), P2 (Green), fault(Green/Red) Ethernet port: Link/active(Green), 1000Mbps
	Housing	Metal IP30 protection
	Dimension	54 x 142 x 99 mm
	Weight	Unit Weight: 2.4 lbs. Shipping Weight: 3.2 lbs
	Mounting	DIN-Rail Mounting, wall-mounting (included)
Power Requirements	Input Voltage	48~55VDC Redundant Input
	Power Connection	1 removable 6-contact terminal block
	Power Consumption	15 Watts (no PD included); 200 Watts @48VDC; 240 Watts @51~55VDC
Environmental Limits	Operating Temperature	STD: -10° to 70° C (14° to 158° F); EOT: -40° to 75° C (-40° to 167° F)
	Storage Temperature	-40°C ~ 85°C (-40°F ~ 185°F)
	Ambient Relative Humidity	5 to 95%, (non-condensing)
Regulatory Approvals	EMI	FCC Class A
	EMS	IEC6100-4-2/3/4/5/6/8; IEC6100-6-2; IEC6100-6-4
	Stability Testing	IEC60068-2-32 (Free fall) IEC60068-2-27 (Shock) IEC60068-2-6 (Vibration)
	Safety	UL 508 (Pending)
